P1 Assumptions and Comments

To invoke this program, all .java files must be compiled. Then the program can be run from its main class, CarDBMain.java.

I assume the user will provide sensible Cylinder, Year, and Region arguments in adding, removing, and updating the database. Thus I do not check for bounds of these arguments throughout the program.

I assume the user will provide years in a single era, thus only two digit years are kept track of. If any alternate era years are entered into the database I expect the user to understand that the database will treat the relations of years as two digits so 14 is less than 89, etc...
